Product Overview

The Starling Stopper

The Starling Stopper is a bird trap designed to humanely and safely remove young Starlings, at least 1 ½ weeks old, from bathroom and dryer exhaust vents. The trap itself measures 3 ¼" in diameter by 9" in length, weighs less than 8 ounces, and is constructed of durable PVC tubing.

It has a clear plastic one-way door on one end to allow young birds to enter the trap, and a removable nose cone to allow easy removal of birds caught in the trap. The young are enticed into the trap by the adult female Starling perching on the exposed front of the trap (nose cone) where she can also feed them, once captured.

This is a handy tool for those times when you can't get the young birds out of a vent any other way.

Instructions: Remove vent cover and insert Starling Stopper. Secure with duct tape as needed. Remove mesh cap to allow adult to leave. Adult will typically leave in the first few minutes as you have disturb her with noise. Reinstall the mesh cap ensuring that the thicker part of the cap is on the bottom allow female to return and perch. Female will return and call to the young. From outside she will be bale to call and feed. Once young are in the tube, remove entire trap and transfer young to alternate carrying container. Return to vent if necessary until all young are removed.
